CS543 Web Services — Assignment 8 of 12

Build One CampusEats Service as a REST API (Node & Express)

Institute: IIIT Vadodara • **Instructor:** Dr. Pramit Mazumdar • **Team:** 11

👥 Team 11 Members

Member Name	Roll Number	Role & Contribution
Nandini Kanaujiya	`20251651061`	REST routes, data validation & request handlers
Radhika Verma	`20251651075`	Middleware integration & schema architecture
Alka Jha	`20251651013`	Frontend fetch integration & dynamic refresh
Alok Mishra	`20251651014`	Testing, status code verification & recording

📝 Answers to Assignment Questions

1. Which CampusEats service did you pick, and what are its routes (method + path)?

We selected the **Menu / Catalogue Service** of CampusEats (Entity: `id`, `name`, `price`, `available`).

- `GET /items` — Retrieves the full menu catalogue array.
- `GET /items/:id` — Retrieves one dish by ID (or returns 404).
- `POST /items` — Creates a new dish record and appends it to the in-memory array.

2. Which status codes did you return, and for which outcomes?

- `200 OK`: On `GET /items` (full list returned) and `GET /items/:id` (dish found).
- `201 Created`: On `POST /items` upon successful record creation.
- `404 Not Found`: On `GET /items/:id` when the specified ID does not exist.
- `422 Unprocessable Entity`: On `POST /items` when client omits the required `name` field.

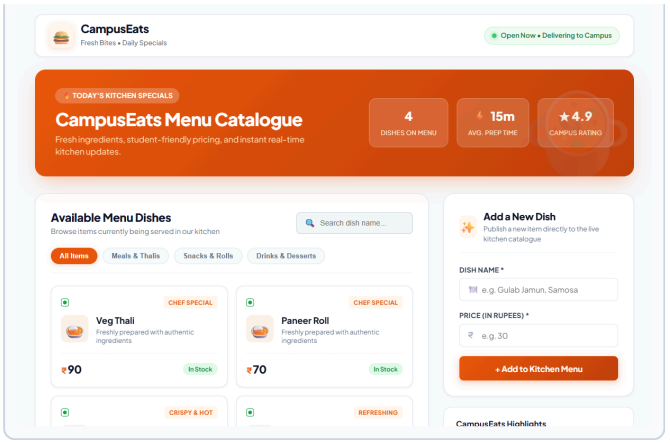

3. Where did you use req.params and where req.body? Why does POST need express.json()?

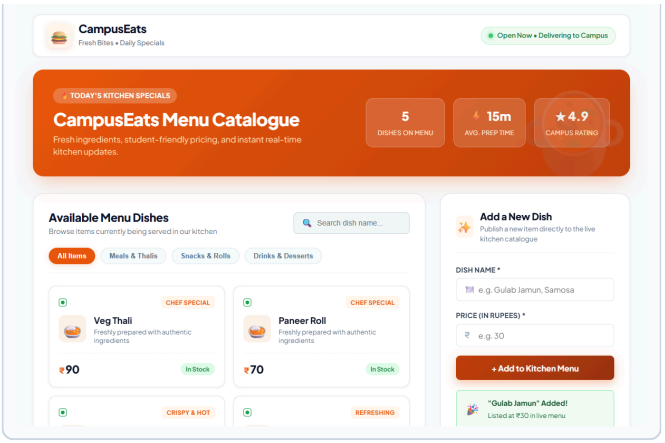

- `req.params` is used in `GET /items/:id` via `req.params.id` to read the URL path parameter.
- `req.body` is used in `POST /items` to access the sent JSON object (`name`, `price`, `available`).
- **Why POST needs express.json():** Incoming HTTP request bodies arrive as raw, chunked data streams. The `express.json()` middleware parses the raw stream of `application/json` payloads into a structured JavaScript object on `req.body`.
